

Correlation: The Strength of a Linear Trend

Linear Trend

- Strong linear trend
 - Points tightly packed around regression line
- Weak linear trend
 - Points scattered around regression line

Linear Trend

Linear Trend

Linear Correlation Coefficient

- Also known as the *Pearson product moment correlation coefficient*

Linear Correlation Coefficient

- Properties
 - The correlation coefficient is always between -1 and 1, inclusive, that is, $-1 \leq r \leq 1$
 - r is a measure of the strength of linear relation

Linear Correlation Coefficient

- Properties
 - *The correlation coefficient is always between -1 and 1, inclusive, that is, $-1 \leq r \leq 1$*
 - $r = 1$ is the perfect positive linear relation between two variables

Linear Correlation Coefficient

- Properties
 - *The correlation coefficient is always between -1 and 1, inclusive, that is, $-1 \leq r \leq 1$*
 - $r = -1$ is the perfect negative linear relation between two variables

Trend/Association

- Positive Trend
 - Two variables are positively associated if the values of the output increase as the values of the input increase
- Negative Trend
 - Two variables are negatively associated if the values of the output decrease as the values of the input increase

Linear Correlation Coefficient

- Properties
 - The closer r is to 1 the stronger the evidence of positive association between two variables
 - The closer r is to -1 the stronger the evidence of negative association between two variables

Linear Correlation Coefficient

- Properties
 - If r is close to 0 then there is evidence of no linear relation between the two variables
 - CAUTION: r close to zero provides evidence that there is no *linear* relation but it does not imply that there is no relation between the variables

Linear Correlation Coefficient

- Also known as the *Pearson product moment correlation coefficient*

- *Guessing Correlations*

Linear Correlation Coefficient

- Hand calculations or table calculations -

$$r = \frac{n \left(\sum xy \right) - \left(\sum x \right) \left(\sum y \right)}{\sqrt{n \left(\sum x^2 \right) - \left(\sum x \right)^2} \sqrt{n \left(\sum y^2 \right) - \left(\sum y \right)^2}}$$

Linear Correlation Coefficient

- Properties
 - The linear correlation coefficient is a unit-less measure of association
 - The units of measure of x and y play no role in the interpretation of r

Linear Correlation Coefficient

$$r = \frac{n \left(\sum xy \right) - \left(\sum x \right) \left(\sum y \right)}{\sqrt{n \left(\sum x^2 \right) - \left(\sum x \right)^2} \sqrt{n \left(\sum y^2 \right) - \left(\sum y \right)^2}}$$

$$r = \frac{\sum xy - \frac{\left(\sum x \right) \left(\sum y \right)}{n}}{\sqrt{\sum x^2 - \frac{\left(\sum x \right)^2}{n}} \sqrt{\sum y^2 - \frac{\left(\sum y \right)^2}{n}}}$$

Linear Correlation Coefficient

$$r = \frac{S_{xy}}{\sqrt{S_{xx}}\sqrt{S_{yy}}}$$

$$r = \frac{\sum \left(\frac{x - \bar{x}}{S_x} \right) \left(\frac{y - \bar{y}}{S_y} \right)}{n-1}$$

Linear Correlation Coefficient

$$r = \frac{1}{n-1} \sum \left(\frac{x - \bar{x}}{S_x} \right) \left(\frac{y - \bar{y}}{S_y} \right)$$

$$r = \frac{1}{n-1} \sum \left\{ \left(\frac{x - \bar{x}}{S_x} \right) \left(\frac{y - \bar{y}}{S_y} \right) \right\}$$

Recall for

Least Squares Regression Line

- For the least squares regression line $y = mx + b$,

- Slope:

$$m = \frac{\sum (x - \bar{x})(y - \bar{y})}{\sum (x - \bar{x})^2}$$

- Y-coordinate of y-intercept: $b = \bar{y} - m\bar{x}$

Least Squares Regression Line

- For the least squares regression line $y = mx + b$,

- Slope:

$$m = r \frac{S_y}{S_x}$$

- Y-coordinate of y-intercept:

$$b = \bar{y} - m\bar{x}$$

Error and Correlation

- Sum of the Squared Errors (SSE)
 - Using residuals for the least squares line

$$SSE = \sum (y - \hat{y})^2$$

y - data value; $\hat{y}$ - predicted value

Error and Correlation

- Sum of the Squared Errors (SSE)
 - Using residuals for the least squares line

$$SSE = \sum (y - \hat{y})^2$$

(x, y) -corresponding pair of data values

$\hat{y} = mx + b$ -predicted value

Error and Correlation

- Total Sum of the Squared Error (SST)
 - Using deviations from the mean

$$SST = \sum (y - \bar{y})^2$$

y - data value; $\bar{y}$ - mean

Error and Correlation

- If $\frac{SSE}{SST}$ is near 0 then the variables have a strong linear relationship
- If $\frac{SSE}{SST}$ is near 1 then the variables have a weak linear relationship

Error and Correlation

- How is $\frac{SSE}{SST}$ related to the correlation coefficient?

Error and Correlation

- How is $\frac{SSE}{SST}$ related to the correlation coefficient?
- $r^2 = 1 - \frac{SSE}{SST}$

or, if you prefer,

$$r^2 = \frac{SST - SSE}{SST}$$
